

1. Cohere Embed api –

The screenshot displays the Postman application interface. On the left, a sidebar shows a collection of API requests under 'Cohere API v2', with 'POST Embed' selected. The main workspace shows the details of this request. The method is 'POST' and the URL is '[[base_url]] /v2/embed'. The 'Headers' tab is active, showing 'Authorization' as 'Bearer [[api_key]]' and 'Content-Type' as 'application/json'. The 'Body' tab shows a JSON payload:

```
{  "id": "2e45c91b-1dde-4424-9721-afbb39f7a3c8",  "inputs": [    {      "content": [        {          "type": "text",          "text": "hello world"        }      ]    }  ],  "embeddings": {    "float": [      -0.01721637,      0.012777774,      -0.0131148385,      0.0131148385,      -0.003732455,      0.022865491,      -0.041157881    ]    }  }
```

 The response status is '200 OK' with a response time of 2.29 s and a size of 6.45 KB. The response body is a JSON object containing an ID, inputs, and embeddings. The Windows taskbar at the bottom shows the system clock as 09:44 PM on 29-07-2026.

Here's a fun fact about space:\n\n**A day on Venus is longer than a year on Venus.** \n\nBecause Venus rotates very slowly in the opposite direction to most planets (a phenomenon called retrograde rotation), it takes about **243 Earth days** for Venus to complete one full spin (a "day"). Meanwhile, it only needs about **225 Earth days** to orbit the Sun once (a "year"). So, if you could stand on Venus, you'd experience a "day" that's longer than the entire "year"! \n\nThis slow, retrograde rotation also means the Sun rises in the west and sets in the east on Venus, and the planet's thick, toxic atmosphere traps heat, making its surface temperature a scorching -465 °C (869 °F)-hot enough to melt lead. 🌋"
