

1. Chat

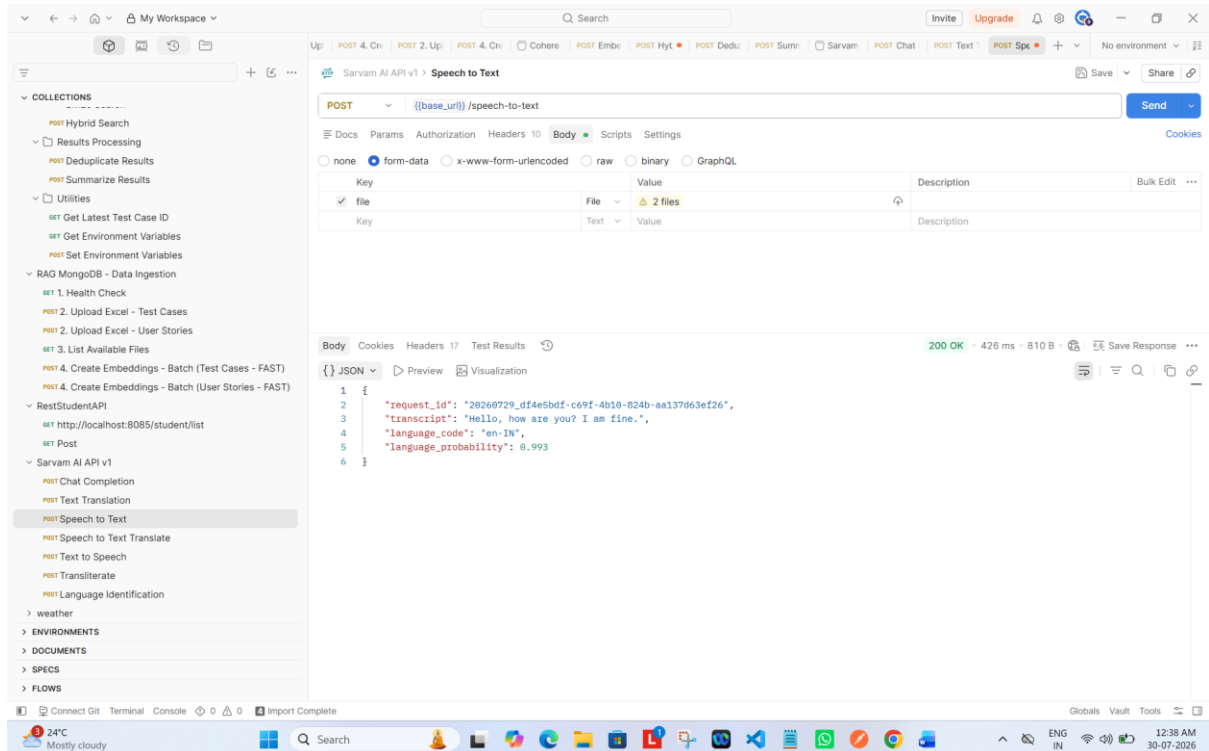

The screenshot displays the Sarvam AI API v1 interface for a Chat Completion endpoint. The left sidebar shows a collection of APIs, with 'Sarvam AI API v1' selected. The main panel shows a POST request to '[[base_url]] /v1/chat/completions'. The response is a 200 OK status with a 10.76s response time and 9.42 KB of data. The JSON response is as follows:

```
1 {
2   "id": "28268729_8ffb6d91-2ecc-43c1-9918-6d97e5abc59f",
3   "choices": [
4     {
5       "finish_reason": "length",
6       "index": 0,
7       "logprobs": null,
8       "message": {
9         "content": "Of course! The universe is an almost incomprehensibly vast and fascinating place. Here's a breakdown of some of the most mind-blowing things we know about it, from the big picture to the tiny details.\n\n1. The Big Picture: What is the Universe?\nAt its simplest, the universe is everything. It's all of space and time, and all the matter and energy within them. It contains you, me, the Earth, the Sun, the Milky Way galaxy, and every other galaxy we can see.\n\nThe most important thing to understand is that the universe has no defined 'edge' or 'center.' It is all of space itself, which is constantly expanding.\n\n2. Mind-Boggling Scale\nThe numbers are so large they're hard to grasp.\n\nThe Observable Universe: This is the part of the universe from which light has had time to reach us since the Big Bang (about 13.8 billion years). It has a diameter of about 93 billion light-years. A light-year is the distance light travels in one year, so that's a number so big it's meaningless to most of us. To put it in perspective, if you shrank the entire observable universe down to the size of the Earth, the Milky Way galaxy would be the size of a grain of sand.\n\nAtoms in You: There are estimated to be around 7 x 10^27 atoms in the human body. There are estimated to be around 10^24 to 10^25 stars in the observable universe. So, there are more stars in the universe than there are atoms in every single person who has ever lived.\n\n3. What's the Universe Made Of?\nThis is one of the biggest surprises in modern science. If you could gather all the matter and energy in the universe, you'd find this breakdown:\n\nOrdinary Matter (5%): This is everything you've ever seen or touched. Stars, planets, gas, dust, and you. It's the stuff we're made of, but it's a tiny fraction of the universe's total content and energy."
10      }
11    }
12  ]
13 }
```

2. Translate

3. Speech to text

4. Text to speech

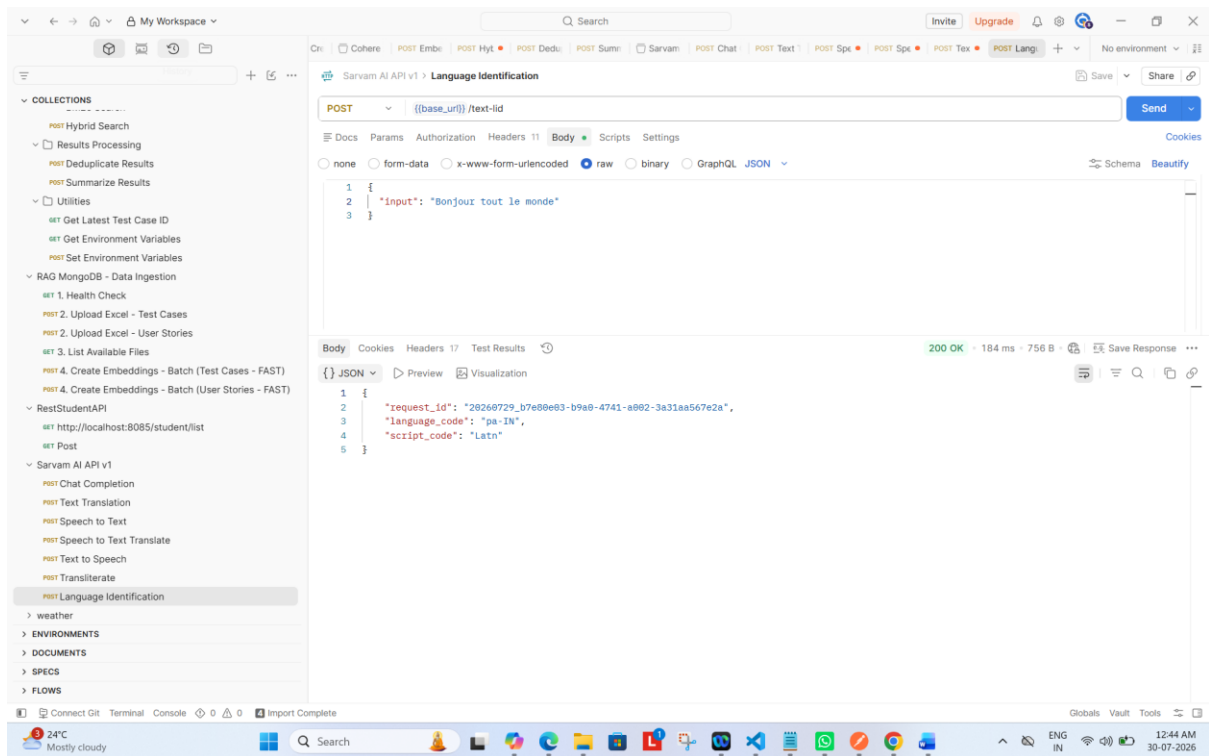

The screenshot displays a REST client interface with a sidebar on the left containing a 'COLLECTIONS' list. The 'Sarvam AI API v1' collection is expanded, showing endpoints like 'Chat Completion', 'Text Translation', 'Speech to Text', 'Speech to Text Translate', 'Text to Speech', 'Transliterate', and 'Language Identification'. The 'Text to Speech' endpoint is selected.

The main panel shows a POST request to '[[base_url]]/text-to-speech'. The request body is a JSON object:

```
{
  "text": "Hi how are you",
  "language": "en-IN"
}
```

The response status is '200 OK' with a body of 559 ms and 51.44 KB. The response body is a long JSON string, which is a base64-encoded audio file. The interface also shows a 'Cookies' tab and a 'Test Results' tab.

5. Language identification

6. Transliteration
